

OrderPulse

When delivery fails, recover the meal – not just the money.

Proactive recovery for late-night food delivery.

OrderPulse detects at-risk deliveries early, keeps customers informed and helps them choose the best recovery option before a failed order becomes a frustrating experience.

KOWSHIK BORAPUREDDY

B2C • Food Delivery • Product Management

EXECUTIVE SUMMARY

01 PROBLEM

Late-night delivery failures are more costly than a refund.

Customers may face changing ETAs, delayed preparation, unreachable delivery partners, or cancellation after waiting too long.

02 INSIGHT

Customers don't want their money back. They want their meal.

A refund solves the transaction — but not the customer's original need.

03 SOLUTION

OrderPulse turns delivery tracking into proactive recovery.

Detect delivery risk early → explain what's happening → recommend the best available recovery option.

04 GOAL

Reduce failed orders while protecting customer trust.

Improve successful recovery, reduce unnecessary support contacts, and minimize late-night customer frustration.

**Don't just explain the problem.
Help the customer recover from it.**

THE PROBLEM & MARKET CONTEXT

Late-night food delivery has a reliability gap.

When an order starts failing, customers often discover it too late to recover their meal.

THE PROBLEM

01

Delivery Uncertainty

ETAs can change without giving customers enough clarity about what is happening.

Preparation delays, stalled tracking, and delivery-partner issues can turn a 45-minute order into a much longer wait.

02

Reactive Recovery

Customers usually act only after the delivery is already failing.

The typical options are waiting longer, contacting support, cancelling, or receiving a refund.

03

Refund ≠ Recovery

A refund fixes the transaction, not the original need.

At late hours, nearby alternatives may already be unavailable.

WHY THIS MATTERS

01

Fewer options at night

Fewer restaurants and delivery partners are available, making it harder to find another meal.

02

Unclear delivery status

Changing ETAs and stalled tracking leave customers unsure about their order.

03

Early action matters

Knowing about a problem early gives customers time to choose another option.

CORE PROBLEM

Food-delivery platforms are good at tracking orders, but customers need help recovering when a delivery is at risk.

USER PERSONA

A late-night customer who needs certainty, not just a refund.

WHO?

Representative persona

RAHUL, 25

Young working professional

Context

- Orders food after long workdays
- Often orders late at night
- Has limited restaurant options after 11 PM
- Expects the ETA shown in the app to be reliable

WHAT HE WANTS

- Food delivered when promised
- Clear and accurate ETA
- Immediate updates when something goes wrong
- A backup option if delivery is at risk

WHAT FRUSTRATES HIM

- ETA keeps changing
- Tracking stops updating
- Delivery partner is unreachable
- Support responds after the problem
- A refund doesn't solve the real need

CURRENT CUSTOMER JOURNEY

What happens when a late-night food order starts going wrong.

PAIN POINTS & ROOT CAUSE

The biggest problem isn't that delivery can fail-it's that customers discover the problem too late to act.

01

Changing ETAs

Customers keep waiting because the estimated delivery time keeps moving.

02

Unclear Status

Tracking may stop updating, leaving customers unsure what is happening.

03

No Early Warning

Customers are usually informed only after the delivery is already in trouble.

04

Limited Recovery

At late hours, nearby restaurants may no longer be accepting orders.

ROOT CAUSE

The system mainly reacts to delivery failure instead of identifying delivery risk early.

01

Delivery signals are fragmented

02

Risk is detected too late

03

Recovery options disappear

PRODUCT MANAGEMENT INSIGHT

The opportunity is not simply to improve tracking. It is to give customers enough warning and options to recover their meal before it is too late.

COMPETITIVE & ALTERNATIVE ANALYSIS

Today's tools help customers track orders, receive updates or recover after a problem.

ALTERNATIVE		WHAT IT DOES	WHEN IT ACTS	CUSTOMER CONTROL	KEY GAP
01	 Standard Order Tracking	Shows order status, ETA, and delivery progress.	During the order	Low	It informs the customer but does not actively help them recover when risk appears.
02	 ETA Notifications	Updates customers when the estimated delivery time changes.	After the ETA changes	Low	Customers know the order is late, but are not necessarily given a recovery decision.
03	 Customer Support	Helps customers resolve delivery problems and complaints.	After the customer seeks help	Medium	Support is mainly reactive and may come after valuable recovery time has already passed.
04	 Cancel & Refund	Ends the failed order and returns the eligible payment.	After significant failure or cancellation	Medium	It resolves the transaction, but does not solve the customer's original need for a meal.
05	 OrderPulse	Monitors order risk, warns the customer early, and recommends available recovery options.	Before failure becomes unavoidable	High	Designed to close the gap between detection and recovery.

TRACK

DETECT RISK

WARN

OFFER OPTIONS

RECOVER

THE PRODUCT GAP

Existing solutions mainly help customers understand or resolve a failed delivery. OrderPulse focuses on the moment **before** failure — when customers still have time to choose a better outcome.

OrderPulse is not another tracking feature. It is a proactive recovery layer.

OPPORTUNITY & SOLUTION OPTIONS

The opportunity is to help customers act before recovery options disappear.

THE OPPORTUNITY

When delivery risk becomes visible early, customers can still choose how they want to recover.

- Warn customers before the delay becomes critical.
- Explain what is happening instead of showing only a changing ETA.
- Surface available recovery options while they still exist.

SOLUTION OPTIONS

01 BETTER NOTIFICATIONS Improve delay alerts and clearly explain when an order is at risk.	Strength: Easy to implement. Limitation: Still depends on the customer deciding what to do.
02 RECOVERY ASSISTANT Detect delivery risk and guide customers toward the most suitable recovery option.	Strength: Combines early warning with decision support. Limitation: Requires reliable delivery risk signals.
03 PROACTIVE RECOVERY ENGINE Continuously monitor order risk, warn customers early, evaluate available alternatives, and recommend the best recovery path.	Strength: Addresses the complete problem from detection to recovery. Limitation: Requires stronger data, operational integration, and experimentation.

WHY ORDERPULSE?

OrderPulse combines early risk detection, proactive customer communication and recovery options in one experience.

ORDER MONITORING

RISK DETECTION

CUSTOMER WARNING

RECOVERY OPTIONS

CUSTOMER CHOICE

TRADITIONAL VS AI APPROACH

Use rules for clear delivery events. Use AI where prediction and recommendation add value.

MVP-PROACTIVE DELIVERY RECOVERY

Start with one focused goal: detect delivery risk early and help the customer recover before it is too late.

CUSTOMER EXPERIENCE

Warn early → Explain clearly → Give the customer a choice

MVP CORE CAPABILITIES

01 DELIVERY RISK MONITORING

Continuously monitor:

- ETA changes
- Preparation delays
- Tracking progress
- Delivery movement

Identify when an order starts moving outside its expected delivery pattern.

02 EARLY WARNING

Trigger a customer notification when meaningful delivery risk is detected.

Give customers enough time to make a decision before the delay becomes critical.

03 RECOVERY OPTIONS

Present available choices:

- Keep waiting
- Find another option
- Cancel & refund

Give customers control instead of making them wait for support.

04 RECOVERY RECOMMENDATION

Recommend the most suitable available option based on:

- Delivery risk
- Remaining delivery time
- Available alternatives

Help the customer choose the best recovery path.

WHAT WE BUILD IN V1

IN SCOPE

- ✓ Order risk monitoring
- ✓ Early customer warnings
- ✓ Recovery options
- ✓ Recovery recommendation
- ✓ Basic alternative discovery

OUT OF SCOPE

- ✓ Fully autonomous cancellation
- ✓ Guaranteed replacement delivery
- ✓ Complex personalization
- ✓ Restaurant-side optimization
- ✓ Fully autonomous customer support

MVP PRINCIPLE

Give customers a useful warning and a meaningful choice before the recovery window closes.

WHY THIS MVP?

The first version focuses on the smallest product experience that can test whether proactive intervention improves successful meal recovery and reduces customer frustration.

USER FLOW — PROACTIVE RECOVERY

OrderPulse detects delivery risk early, warns the customer, and gives them a recovery choice.

THE CUSTOMER GETS A CHOICE BEFORE THE RECOVERY WINDOW CLOSES.

PRODUCT REQUIREMENTS DOCUMENT

Defining what OrderPulse must do to detect delivery risk and enable proactive recovery.

PRODUCT OBJECTIVE

Detect meaningful delivery risk early, warn the customer in time, and provide the best available recovery choices before the recovery window closes.

FUNCTIONAL REQUIREMENTS

01

MONITOR DELIVERY RISK

- ETA changes
- Preparation delays
- Tracking inactivity
- Delivery progress

Identify meaningful signals that an order may become significantly delayed.

02

DETECT & WARN

Detect meaningful delivery risk and notify the customer before the delay becomes critical.

- What is happening
- Why the order may be delayed
- That recovery options may be available.

03

PRESENT RECOVERY OPTIONS

When an order is at risk, show the recovery choices that are currently available.

- Keep waiting
- Find another option
- Cancel & refund

The customer makes the final decision.

04

RECOMMEND A RECOVERY PATH

Use delivery risk, remaining delivery time, and available alternatives to recommend the most suitable recovery option.

The recommendation assists the customer. It does not make the decision automatically.

KEY PRODUCT RULES

01

WARN BEFORE IT IS TOO LATE

Give the customer enough time to make a recovery decision.

02

SHOW ONLY AVAILABLE OPTIONS

Do not present recovery choices that are no longer realistically available.

03

KEEP THE CUSTOMER IN CONTROL

OrderPulse recommends an action, but the customer decides what to do.

PRODUCT CONSTRAINTS

REAL-TIME SIGNALS – Risk detection depends on reliable order and delivery signals.

CUSTOMER CHOICE – The system recommends but does not automatically decide for the customer.

AVAILABLE ALTERNATIVES – Recovery options depend on what is actually available at that moment.

RECOMMENDATION, NOT AUTOMATION.

USER STORIES & PRIORITY

What customers need from OrderPulse — and what we build first.

CUSTOMER NEED COMES FIRST. PRIORITY DETERMINES WHAT WE BUILD FIRST.

PRIORITIZED USER STORIES

PRIORITY	USER STORY	CUSTOMER NEED	ORDERPULSE MUST PROVIDE
P0 / MUST HAVE	Know when an order is at risk of a major delay — act before it is too late.	EARLY AWARENESS	Detect meaningful delivery risk and warn the customer early.
P0 / MUST HAVE	Understand why the order is at risk.	CLARITY	Explain the delivery risk clearly and simply.
P0 / MUST HAVE	See the recovery options available.	CHOICE	Show realistic options: Keep waiting, find another option, or cancel & refund.
P1 / SHOULD HAVE	Get a recommendation for the best available recovery option.	DECISION SUPPORT	Recommend the most suitable option using delivery risk, remaining time, and available alternatives.

P0 — MUST HAVE

required for the core experience

P1 — SHOULD HAVE

improves the experience, but is not required for the first release.

THE CORE JOB IS TO GIVE CUSTOMERS TIME TO ACT.

OrderPulse is valuable when it turns early risk detection into a better recovery decision.

METRICS & EXPERIMENTATION

How we measure whether proactive recovery actually improves the customer outcome.

NORTH STAR METRIC

SUCCESSFUL MEAL RECOVERY RATE

Percentage of at-risk orders where the customer successfully chooses a recovery path that avoids a failed meal experience.

The goal is not simply to reduce refunds. The goal is to help more customers successfully recover their meal.

SUPPORTING METRICS

01

EARLY WARNING RATE

Measures whether at-risk customers are warned early enough to act.

02

FAILED ORDER RATE

Measures whether proactive recovery reduces failed delivery experiences.

03

SUPPORT CONTACT RATE

Measures whether proactive warnings and recovery choices reduce reactive support needs.

HOW WE TEST IT

CONTROL

Standard order tracking

- Normal ETA updates
- No proactive recovery warning
- Customer contacts support if needed

VS

ORDERPULSE

Proactive recovery

- Early delivery-risk warning
- Recovery options shown
- Customer chooses how to recover

HYPOTHESIS

If at-risk customers receive an early warning and realistic recovery options, more customers will successfully recover their meal and fewer will require reactive support.

COMPARE:

Successful meal recovery

Failed order rate

Support contact rate

DECISION RULE

If proactive recovery improves successful meal recovery without increasing false alerts or customer frustration, expand the experience. Otherwise, refine the risk signals, warning timing, or recovery options before scaling.

BUSINESS IMPACT

OrderPulse turns delivery-risk detection into better customer outcomes and stronger platform operations.

CORE BUSINESS VALUE

OrderPulse helps customers recover before a delivery failure becomes unavoidable.

01 CUSTOMER

BETTER CUSTOMER OUTCOME

- Warn customers before the problem becomes critical
- Give customers realistic recovery choices
- Reduce uncertainty and frustration

MORE CONTROL

02 OPERATIONS

MORE PROACTIVE RECOVERY

- Resolve problems before customers contact support
- Reduce unnecessary reactive support
- Give support teams fewer avoidable recovery cases

LESS REACTIVE WORK

03 BUSINESS

STRONGER PLATFORM VALUE

- Reduce failed delivery experiences
- Protect customer trust
- Improve the value of each successful order

BETTER ORDER OUTCOMES

WHAT SUCCESS LOOKS LIKE

01 MORE MEALS RECOVERED

More at-risk customers successfully recover their order.

02 FEWER FAILED EXPERIENCES

Fewer orders end with long waits, cancellation, or an avoidable failure.

03 LESS REACTIVE SUPPORT

More customers receive useful information and choices before contacting support.

ORDERPULSE DOES NOT JUST REDUCE DELIVERY PROBLEMS. IT IMPROVES WHAT HAPPENS AFTER A DELIVERY PROBLEM IS DETECTED.

The business value comes from helping more customers reach a better outcome before the recovery window closes.

RISKS & TRADE-OFFS

Proactive recovery creates value only when warnings are accurate, options are realistic, and customers remain in control.

PM PRINCIPLE

Do not intervene just because a delay is possible.
Intervene when the risk is meaningful and a useful recovery option exists.

KEY RISKS & MITIGATIONS

RISK	WHY IT MATTERS	MITIGATION	PRODUCT DECISION
01 ⚠️ FALSE ALERTS	Customers may be warned even when the order is likely to arrive normally, creating unnecessary anxiety.	Use conservative risk thresholds and continuously evaluate false-alert rates.	Warn only when multiple signals indicate meaningful delivery risk.
02 ✅ UNREALISTIC RECOVERY OPTIONS	Showing an option that is unavailable or impractical can make the experience worse.	Only show recovery options that are actually available at that moment.	Availability must be checked before an option is presented.
03 🔔 TOO MANY WARNINGS	Frequent notifications can create customer anxiety and notification fatigue.	Trigger a warning only when the delivery risk becomes meaningful.	Prioritize warning quality over warning frequency.
04 👤 CUSTOMER CONTROL	An automated system could make a recovery decision that the customer does not want.	OrderPulse recommends the best available option but does not automatically decide for the customer.	Recommendation, not automation.

KEY TRADE-OFFS

EARLY WARNING	vs FALSE ALERTS	Decision: Prefer fewer, higher-confidence warnings over frequent uncertain warnings.
MORE OPTIONS	vs OPTION QUALITY	Decision: Show fewer options if they are more realistic and actually available.
AUTOMATION	vs CUSTOMER CONTROL	Decision: Recommend the next best action, but let the customer make the final decision.

PRODUCT GUARDRAIL

ORDERPULSE SHOULD NEVER CREATE A NEW PROBLEM WHILE TRYING TO SOLVE AN OLD ONE.
Every proactive warning must be: ACCURATE + ACTIONABLE + CUSTOMER-CONTROLLED

PRODUCT ROADMAP

We Build the core recovery experience → validate customer value → scale what works.

DECISION GATES	01 RELIABLE RISK SIGNAL Can we identify meaningful delivery risk early?	02 CUSTOMER CAN ACT Do customers receive a useful choice before it is too late?	03 PROVEN VALUE Does proactive recovery improve the outcome?
	01 FULLY AUTOMATED CANCELLATION Customer remains in control.	02 GUARANTEED REPLACEMENT DELIVERY Requires deeper operational integrations.	03 COMPLEX PERSONALIZATION Validate the core recovery experience first.

BUILD THE CORE. PROVE THE OUTCOME. SCALE WHAT WORKS.

— LESSONS I LEARNED

What I learned about problem framing, prioritization, customer control and validating a product idea through the OrderPulse case.

START WITH THE CUSTOMER PROBLEM

A refund may solve the transaction, but it does not always solve the customer's actual need.

TIMING CAN CHANGE THE OUTCOME

A delivery problem is easier to recover from when the customer knows about it early enough to act.

PRIORITIZE THE SIMPLEST USEFUL MVP

The first version should focus on detecting risk, warning the customer and providing realistic recovery choices — not trying to automate everything.

AI SHOULD ADD REAL PRODUCT VALUE

We should use AI where prediction, explanation or recommendation improves the experience beyond what simple rules can do.

PM TAKEAWAY

Good product management is not about adding more technology. It is about identifying the **right moment**, giving users **meaningful choices** and measuring whether the intervention **improves the outcome**.

This case study is a proposed product concept. The next step would be validating the assumptions with real customers and operational data.

THANK YOU

Let's build products that solve the right problems.

OrderPulse — Proactive recovery for late-night food delivery.
